25. (New) A wall panel comprising:
 - (a) spaced apart first and second concrete layers;
 - (b) an insulation layer between the concrete layers;
 - (c) a plurality of elongated connectors extending through the insulation layer and having opposite ends embedded in the concrete layers, wherein each connector has longitudinally extending portions, spaced apart and connected by an internal web of thinner or equal thickness; and
 - (d) each connector having first and second anchorage surfaces capable of transferring tension and compression forces along and parallel to the longitudinally extended portions.

26. (New) The wall panel of claim 25 wherein the connectors transfer forces between the first and second concrete layers whereby the wall has a substantially composite character.
27. (New) The wall panel of claim 25 wherein the connectors further comprise a centrally located region comprising a perpendicularly extending lip for locating the connector within the insulation layer, thereby regulating depth of embedment within the concrete layer.
28. (New) The wall panel of claim 25 wherein the connectors are made from a polymer material including fiber reinforcements having thermal conductivity significantly lower than steel.
29. (New) A connector for an insulated concrete wall comprising an elongated wide-body having longitudinally extending portions, spaced apart and connected by an internal web of thinner or equal thickness.
30. (New) The connector of claim 29 further comprising anchoring surfaces adjacent each end, configured such that tension and compression forces are transferred simultaneously through first and second longitudinally extending portions.
31. (New) The connector of claim 29 wherein the connector transfers forces between the first and second concrete layers such that the wall is substantially composite in character.
32. (New) The connector of claim 29 further comprising a centrally located region with a perpendicularly extending lip for locating the connector within the insulation layer, thereby regulating the depth of embedment within the concrete layer.
33. (New) The connector of claim 29 further comprising a polymer material including fiber reinforcements having thermal conductivity significantly lower than steel, wherein the

polymer material is selected from the group comprising fiber-reinforced thermoplastic resin and fiber-reinforced thermoset resin.

34. (New) The connector of claim 29 wherein the opposite first and second anchorage ends are anchored in first and second layers of concrete such that bending, shear, tensile and compressive forces in one of the concrete layers is transferred by the connector to the other of the concrete layers.
